USC Routes Problem Statement

Problem Statement

Students have way too difficult a time walking uphill and managing successful time-management routes to the many different buildings they have to visit for class each day.

Details

Students undergo many of the same thought processes whenever traveling from one building to another; how to get there, and how to get there efficiently. No student wants to travel an extremely long distance uphill when there's a more efficient route that takes them to their destination at a more efficient, faster pace. I know this because I, too, am a student. Nothing is worse than traveling uphill, especially in the heat, to a class that is close to a mile away from where you're staying, which is what actually drove me to identify this as my problem statement.
